[\[Latest draft\]](#) [\[SSRN\]](#) [\[HKIMR\]](#) [\[Job Market Paper\]](#)

Abstract: This paper studies whether shared intermediaries transmit local arbitrage frictions across otherwise distinct trades. I exploit the settlement mismatch created by the 2024 US transition to T+1, while many foreign securities held by US-listed cross-border ETFs continued to settle on T+2. Relative to non-US ETFs tracking the same indices, primary-market arbitrage, measured by flow-mispricing responsiveness, declines among directly exposed cross-border ETFs. The decline appears primarily in creations and generally grows with portfolio exposure to T+2-settled securities. Exposed ETFs also tilt toward T+1-settled securities, experience higher tracking error, and become less liquid. Domestic ETFs face no direct settlement mismatch, yet their flow-mispricing responsiveness declines more when their predetermined reliance on authorized participants (APs) active in cross-border ETFs is greater. The decline associated with this indirect exposure is smaller when AP balance-sheet capacity is greater and larger when poor netting coincides with high global exposure. These findings suggest that market segmentation need not contain a local arbitrage friction when distinct trades draw on shared intermediary capacity.
