WORKING PAPERS

[1] How Far Do Arbitrage Frictions Spread? [SSRN (Latest)] [HKIMR]
(Job Market Paper)

Abstract: This paper shows that policies intended to improve a market's efficiency can create frictions that spill back into the same market through shared arbitrageurs. I exploit a novel settlement mismatch created by the 2024 US transition to T+1: US-listed global ETF shares began settling on T+1 while many of their foreign holdings continued to settle on T+2. Relative to non-US ETFs tracking the same indices, these ETFs' primary-market activity becomes less responsive to mispricing. Although US domestic ETFs face no mismatch, their responsiveness declines more when they rely heavily on authorized participants active in affected global ETFs.
